Background

- Nearly all Americans use the internet or social media daily
- Over 2/3 of Americans use the internet and social media to search for health information
- 86% believe that the information they find on the internet and social media is reliable
- 64% report that the information found on social media influenced their decisions regarding their healthcare
- In reality, the quality of information online and on social media platforms is only correct 13% of the time AND more than ½ of all patients do not discuss their findings or concerns with their physicians
- The noncompliance rate in America is approaching 50%
- 75% use social media
- 70% and 40% to learn about personal medical conditions

Research Questions

- Are our patients using social media platforms to learn about their medical conditions?
- How much do our patients trust the information provided by social media?
- Does social media use cause worry about medical conditions or drugs?
- How polarizing is the internet and social media on making decisions regarding health care?
- Does social media use correlate with poor patient compliance?

Study Design

Part 1: Demographics
- Age
- Education level
- Current medical conditions
- Family history
- Substance use and addiction

Part 2: Social Media Use
- Do you use social media?
- What platforms do you use?
- Purpose for using Social media?
- Number of years using Social media?
- Number of hours per day using Social media?
- How accurate is Social media?
- Does Social media have positive or negative effect on my life?

Part 3: Connections
- Rank on 5 Point Likert Scale from “Strongly Agree to Strongly Disagree”
  - I am satisfied with my current healthcare
  - My physician educates me on my conditions, my medications, and all treatment options
  - My physician ensures my understanding of my conditions and medications
  - I learn about my medical conditions on the internet or on social media
  - I am worried about the current opioid epidemic in the United States
  - News regarding the opioid epidemic has made me fearful of taking medications
  - I will always follow my physician’s recommendations
  - I will always follow my physician’s recommendations for taking pain medications
  - I always follow my physician’s advice for taking all other medications

Conclusions and Future Research

- Over 3/4 of this patient population uses social media regularly, for an average of 2.23 hours a day; however, only 2.6% believe that what they read on social media is accurate
- Higher number of sources used correlates with:
  - Worry about the US Opioid Epidemic
  - Poor adherence with physician recommendations
- Adherence to physician recommendations is significantly correlated with “direct in-office patient education” and “physician ensures patient understanding of conditions and medications” regardless of social media use and attitudes regarding the opioid epidemic

Correlation with “I learn about my medical conditions on the internet or on social media”

- Pearson’s Coefficient (r)

- "I learn about my medical conditions on the internet or social media"
  - 0.162

- "I learn about other medical conditions or global/national medical issues on the internet or social media"
  - 0.287

- "I learn about medical conditions on the internet or on social media"
  - 0.287

- "I was worried about the current opioid epidemic in the United States"
  - 0.145

Correlation with “I learn about my medical conditions on the internet or on social media”

- Pearson’s Coefficient (r)

- "I learn about my medical conditions on the internet or on social media"
  - 0.162

- "I learn about other medical conditions or global/national medical issues on the internet or social media"
  - 0.189

- "I was worried about the current opioid epidemic in the United States"
  - 0.403

- "I will always follow my physician’s recommendations"
  - 0.232

- "I will always follow my physician’s advice for taking pain medications"
  - 0.142
